Optics of 2D and van der Waals materials | Capasso Group

Abstract Designer heterostructures can now be assembled layer-by-layer with unmatched precision thanks to the recently developed deterministic placement methods to transfer two-dimensional (2D) materials. This possibility constitutes the birth of a very active research field on the so-called van der Waals heterostructures.

Recent progress in the assembly of nanodevices and van der ...

Although the 2D materials are interesting in their own right, an even larger potential lies in the possibility of reassembling different 2D crystals into new layered compounds . Such designer materials have been coined van der Waals heterostructures (vdWHs) with reference to the weak van der Waals forces holding the 2D crystal planes together.

The 2D materials are layered material with the thickness of one or more monolayers [66, 67] while atoms in the layer are covalently bonded and the layers are held together by van der Waals (vdW) forces [68]. Dimensional differences produce novel properties different from those of 3D materials.

In commonly used 2D materials, researchers rely on the interaction between the thin layers, known as van der Waals interlayer coupling, to create charge transfer that is then used in devices. However, this interlayer coupling is limited because the charges are traditionally distributed evenly on the two sides of each layer.
