The author adopts a reader-friendly writing style and excellent use of examples to present daunting material in a way students will find exciting instead of burdensome. The text focuses attention on behavior (in preference to physiological mechanisms) and practical human implications, which are reinforced with frequent examples and case studies that keep students engaged in the learning process. Technical details are limited where possible and retained with careful explanations where they enhance understanding. Topics often presented separately are now integrated with other subjects to provide for more meaningful and more interesting discussions. Integration of subjects include language with audition, taste with hunger, olfaction with sexual behavior, and (aspects of) pain with emotion. The more interesting psychological applications (e.g. drugs, sex, emotion) are introduced earlier than in other textbooks to engage the students before plunging into the more technical aspects of the subject. BRAIN AND BEHAVIOR: AN INTRODUCTION TO PSYCHOLOGY comes packaged with a FREE BioPsych CD that allows students to connect directly to the Wadsworth Psychology Resource Center, work through the quiz items, and explore relevant Web links.

This text is intended for a first course in dynamic systems and is designed for use by sophomore and junior majors in all fields of engineering, but principally mechanical and electrical engineers. All engineers must understand how dynamic systems work and what responses can be expected from various physical systems.

When it comes to evaluating a firm, leadership matters. We know that financial outcomes can predict about 50 percent of a firm's market value. Intangibles like strategy, brand, talent, R&D, innovation, risk, and so on account for the rest. But leadership underlies them all. And despite how important we know it is, we've been forced to rely on subjective and unreliable ways to measure its impact—until now. In this landmark book, leadership scholar, author, and consultant Dave Ulrich proposes a "leadership capital index"—a Moody's or Standard and Poor's rating for leadership. Drawing on research from investors and business leaders, and synthesizing the work of dozens of consulting firms and leadership experts, Ulrich analyzes two broad domains, each comprising five factors. The individual domain includes personal qualities, strategic prowess, execution proficiency, interpersonal skills, and fit between the leader's style and the organization's market promises. The organizational domain encompasses a leader's ability to create customer-focused cultures, manage talent, demand accountability, use information to gain competitive advantage, and set up work processes to deal with change. Ulrich details rigorous metrics and methods for evaluating leaders on each of these factors. The result is a groundbreaking book that will be of vital interest not only to equity and debt investors but also to boards of directors, executive teams, human resource and leadership development professionals, government and ratings agencies—and of course to leaders themselves.

The "blue laser" is an exciting new device used in physics. The potential is now being recognized for its development into a commercial lighting system using about a tenth of the power and with a thousand times the operating lifetime of a comparable conventional system. This comprehensive work introduces the subject at a level suitable for graduate students. It covers the basics physics of light emitting diodes (LEDs) and laser diodes (LDs) based on gallium nitride and related nitride semiconductors, and gives an outline of their structural, transport and optical properties, and the relevant device physics. It begins with the fundamentals, and covers both theory and experiment, as well as an examination of actual and potential device applications. Shuji Nakamura and Nichia Chemicals Industries made the initial breakthroughs in the field, and these have revealed that LEDs and LDs are a sophisticated physical phenomenon and a commercial reality.

Clones are not supposed to recall the memories of their genetic host, but a newcomer to the frontier Mars colony can remember his past as Johnathon Wilde, the anarchist who tipped the scales in World War III. Winner of the Prometheus Award. Reprint.
